

## Class 29: Numeric Recursion

**Held:** Tuesday, 11 March 2008

**Summary:** We visit a slightly different kind of recursion, numeric recursion. In this technique, we once again have procedures call themselves. However, the parameter that we “simplify” at every step is a number, rather than a list.

### Notes:

- Sara Bebeau from the Fund for Public Interest Research plans to give an announcement at the start of class.
- I will reserve our normal start-of-class time for comments on campus events.
- Are there final questions on the exam?
- I head off to my conference after class today and am unlikely to have email access until Wednesday afternoon. Please send questions to Dr. Davis.
- Reading for tomorrow: Geometric Art.

### Overview:

- Recursion, Generalized.
- Thinking About Natural Numbers.
- Numeric Recursion.

## Patterns of Recursion

- While we’ve seen and written a variety of examples of direct recursion, they typically have the following form:

```
(define recursive-proc
  (lambda (params)
    (if (base-case-test)
        (base-case params)
        (combine (partof params)
                  (recursive-proc (simplify params)))))))
```

- In many cases, the combination ends up being a choice between two activities. In those cases, we might write:

```
(define recursive-proc
  (lambda (params)
    (cond
      ((base-case-test)
       (base-case params))
      ((special-case-test)
       (combine (partof params)
                (recursive-proc (simplify params))))
      (else
       (recursive-proc (simplify params))))))
```

- For lists, the simplification was almost always “take the cdr” and the “part-of” was almost always “take the car”.

## Recursion with Numbers

- While most of the recursion we’ve been doing has used lists as the structure to recurse over, you can recurse with many different kinds of values.
- It is fairly common to recurse using numbers.
- The natural base cases for integers are when you hit 0 or when you hit 1.
- The natural simplification step for recursive procedure using numbers calls typically involves subtracting 1 from the argument.
  - Other simplifications, such as dividing in half, are also possible.

## Lab

- Do the lab.
