Class 03: Programming Bioinformatics

Held: Thursday, 1 September 2011

Summary: We continue our exploration of the basics of bioinformatics by doing a bit of programming.

Related Pages:
- EBoard.
- Due: Write up of Web exploration 1.

Notes:
- About the papers.
- We have posted answers to your questions on the introductory survey.
- We will soon post answers to your more administrative questions.
- A note on Piazza.
- For the next class, read Chapter 2 of Exploring Bioinformatics and bring questions. (You don’t need to do the chapter 2 Web exploration yet, and you certainly don’t need to understand all of the code.)
- As you may have noted, we will use a different language in class than they use in the book. We will explore the differences in the lab and reflection.
- EC: CS Extra today at 4:30 - HCI for Peace.
- EC: Bio Grad School seminar Friday at noon.
- Chase will hold a mentor session ___ and will have office hours ___.

Overview:
- Reflections on the web exploration.
- About algorithm design.
- A sample algorithm.
- More Python basics.
- Lab: Project 1.4.
- Reflection.

Reflection on the Web Exploration
- What did you learn from the Web exploration?
- Some things you might have noted:
  - There’s a lot of information on each page. Often, you have to spend some effort to find the key info you want.
  - There’s a lot of information in the databases, you just need to know how to find it.
  - Talking things out is a good idea.
  - You may need to rely on colleagues for help.
Conversely, when you notice something particularly interesting, you should share it.

Algorithms and Programming

- What did St. Clair and Visick teach you about algorithms and programming?

A Sample Algorithm: Sorting Students

- Suppose we have a small group of students and want to put them in order by the distance of their home from Grinnell.
- Write instructions that a relatively clueless faculty member could follow.
  - Biology students should write the instructions.
  - CS students should ask questions to help the Biology students write better instructions.
- And yes, I’ll try to follow them.

More Python Basics

What you’ve learned so far

- The model we’re using
  - Long-standing code goes at the top.
  - Interactive experimentation in the bottom.
- Assignment
  - We have named storage locations and can store and change the values in them.
- Functions
- Lists/Sequences
  - Used to provide an indexed collection of values.
- Strings
  - Surrounded by quotation marks.
- Getting help
  - help(thing)
- Organization
  - Indentation is significant Some new topics
- Conditionals

```
if test:
    consequent
else:
    alternate
```

- Adding elements to lists/sequences

```
sequence.append(value)
```

- Loops
Lab Exercise

- Labs based on the book are in the [Exploring Bioinformatics with Python](http://example.com) section of the Web site, which you can reach by clicking on ExBioPy at the top of any page.
- I’ll try to set up our labs link to link to them (directly or indirectly).
- For today’s lab, you’ll look at two things in ExBioPy.
  - Start by reading a translation of Algorithm 1.3 into Python.
  - Continue with followup exercises.
- You may have to continue the lab on your own.
- You do not need to turn anything in, but you should finish it.

Followup

- What went well in the lab?
- What went poorly?
- What do you see as the strengths and weaknesses of the Rebelsky/Python approach vs. the St.Clair+Visick/Perl approach?
