

R Notes for Topic-27 Homework Activities

Activity 27-12: Monthly Temperatures

You will need to create a data frame (or two vectors) in order to do the analysis. Here's a start.

```
RNCtemps = data.frame(Month=1:12, AvgTemp = c(39, 42, ...))
```

Activity 27-18: Solitaire

You can load the data from the file `Solitaire.csv`.

One nice thing about R's `cor` is that, when given a data frame as a parameter, it computes all the pairs of correlation coefficients.

```
cor(Solitaire)
```

Activity 27-19: Climatic Conditions

You can load the data from the file `Climate.csv`.

We can once again take advantage of R's willingness to compute simultaneously lots of correlation coefficients. However, this time we need to throw away one column (the city names). So, we need to coefficients for columns 2-9.

```
Climate2 = Climate[,2:9]
```

You should be able to figure out the rest.
